

Prompt 1 - Building a revenue & spending dashboard

I want you to create a web based password secured dashboard for me that allows me to track my entire business revenue and spending.

The dashboard should be hosted at the domain <https://dashboard.rosalia-yachts.com> (DNS record pointing to server IP already exists).

The SQLite data base that stores the numbers and all files required should be stored at the server (you have access to that server via the credentials in .env. (ssh login and password))

Here is the functionality I wish for the dashboard:

- 1) Right after the Login I want a beautiful overview for the entire year, how much money was earned and how much was spent every single month. Implement a diagram that makes it easy to see what was the revenue, the win after costs, how much was spent every single month. Also show the total numbers for the entire year somewhere.
- 2) Under the Diagram I want an easy to read overview how much money was earned from which source (I want different categories that I set up but also an opportunity to create new ones in the dashboard) and also how much money was spent for what (different categories I set up as default but also want to have the opportunity to set up new spending categories within the dashboard). Separate the earning and spending generally in two categories each (Earnings: Revenue / Deposit) and (Spending: Business / Privat Withdraw) When the user logs new revenue/spending these categories must also be asked besides the sub categories.
 - Set up these Sub Categories already in the Category **Revenue**: AI Automation, Courses, YT Colab, Other
 - Set up these Sub Categories already in the Category **Deposit**: Bank Transfer
 - Set up these Sub Categories already in the Category **Business**: Software & Tools, Equipment, Travel & Transport, Other
 - Set up these Sub Categories already in the Category **Privat Withdraw**: Accommodation, Transport, Food, Savings, Other
- 3) I want the opportunity to log new revenue/spending by selecting these categories and the amount (optionally I want to have the opportunity to upload an invoice)
- 4) I want to have an opportunity to scroll through all logged revenue and spending and I want to have the opportunity to also later upload an invoice even after the revenue/spending is already logged.
- 5) I want to see also a nice diagram in the Dashboard, how much of a Surplus after Spending I have every single month (if it still looks good you can also integrate that into the main diagram)
- 6) I also want to see how much I spend per category (make this clickable so the diagram changes)
- 7) I want to have the opportunity to download all Revenue Invoices and also all Spending invoices by selecting a date range and then clicking "download invoices" (all invoices should be downloaded in a zip folder)
- 8) I also want the opportunity to export a detailed pdf report for a certain date range by selecting a range and clicking on "Create Report"

Design: Give the dashboard a design that matches the design and colors of the website you already created (index.html). Make the dashboard look very professional and sleek so it is fun to work with it.

Create the Frontend of that dashboard using the Front End design Skill already existing in this Project. Very Important, make the dashboard also responsive so it can be used via the phone.
