

I want you to create a web based application for me that can be used to create invoices for certain services and send them out to customers via Email. The tool should be based on a Python Flask App running on a Cloud Server and it should be usable via a html based Dashboard, secured by a simple Password Login. Create the frontend using the frontend design skill. Here are the details about the system:

- 1) I need the opportunity to import existing clients via a csv file that contains the following information about each customer:
 - Customer Number
 - Email
 - Company Name
 - Address
- 2) I need the opportunity to set up new customers in the dashboard having the same data points
 - Customer Number
 - Email
 - Company Name
 - Address
- 3) I need the opportunity to also delete customers in the dashboard and then they should also be removed from the data base.
- 4) In the background I want a simple SQLite data base that contains all the customer information but also how much a customer already spent in the past. So that when a customer is viewed in the dashboard the user sees the past revenue (total revenue until this point). Also we need the information stored if an invoice is open currently (see dashboard wishes and I want to be able to also download in the future past invoices of a customer)
- 5) I want the opportunity to set up selectable default products/services in the dashboard so that I can just select one or more of them to create an invoice fast with a few clicks. Nevertheless everything still needs to be manually adjustable as well after a product/service is selected to have flexibility to manually adjust things like the price. I also want to have the opportunity to write the Description, Amount, Price, Discount completely manually and also I want to be able to set up new default products/services that I can just select.
- 6) Set up these default services from the beginning:
 - AI Assessment for recruiting agencies: 2500 € / Month
 - AI Assessment for coaches: 2000 € / Month
 - Process Automation customer support: 2500 € / Month
- 7) I want the tool to always calculate the contained VAT of 19% automatically and state it as shown in the example invoice.
The calculation for the VAT is: $((\text{Service Price}) / 1.19) - (\text{Service Price}) \times (-1)$
- 8) Right after a successful Login in the Dashboard I want to see a nice overview with Total invoiced Revenue, Total invoiced Revenue of the current Year, currently open Invoices (with checkboxes so the user can tick them off when the customer paid)

9) Here is the exact flow that I wish for the Application when working with it:

- User logs in to the dashboard
- User ticks of a recently payed invoice or heads over to creating an invoice
- User clicks "Create Invoice"
- User selects an existing client or sets up a new client
- User selects a product/service or enters the information manually
- The system enters the correct ongoing Invoice number and date (both manually adjustable if needed. Ask for starting invoice number when building the system)
- User clicks "Finalize Invoice"
- A pdf invoice gets created and stored in the dashboard/data table with a download option. The pdf invoice is called "Invoice_[INVOICE_NUMBER]" and always the current number gets entered.
- User clicks "Send Invoice" and Invoice gets send as attachment via email to the customer. (See default email text)
- User sees now in the client overview that an invoice got send and when it got send.
- User sees in the dashboard that a new open invoice exists and since when it exists

10) Design Information:

- Give the dashboard a cool/clean modern design and use similar colors as used for my existing website of AI Experts (index.html).
- Make the entire Dashboard intuitive and easy to work with
- Include the company logo somewhere where it makes sense (provided in the project folder)

11) Invoice Design:

- Look at the provided invoice and try to recreate that as close as possible.
- Use for "Amount" the default value "1".

12) Invoice Drafts: We need the opportunity to save the Invoice as draft if we don't want to send it out right away. Drafts also should be deletable if no longer needed.

13) Invoice Number Logic: For the invoice number we need the following logic. Everything starts with the starting number I tell you. This number is suggested and prefilled into the first invoice created. BUT: When a new invoice gets created before that one got send out it should get the same invoice number. The only thing that decides if the next invoice number is due is the last invoice number that actually got sent out. We have to make sure that we send out the numbers in an uninterrupted continuous chain. Because of that, when a draft gets reopened there must be an automated invoice number check of the already sent out numbers and the correct due invoice number has to be added to the invoice. Nevertheless the invoice number should also be manually adjustable in the dashboard, but with a warning showing up if the used invoice number was already sent out.

14) Important Final Information:

- Create the Dashboard and the Invoices in English as it is for a Company called "AI Experts"
- Deploy the app and the dashboard to the server (You got access in .env) and the domain: <https://invoices.rosalia-yachts.com>
- Make the invoice tool dashboard also responsive so it can be used via the phone.
