

Prompt 1 - Skill Creation AI Images and Blog Posts

I want you to include a blog to my website that can be reached via a link in the header "Blog". The content will be produced by a skill I want you to create next.

I want you to create a skill for me that does the following:

- It asks the user to provide a blog post idea, a url leading to an information source or any other form of information.
- The skill reads the provided information and turns it into an interesting and relevant Blog post for my website
- The Blog posts should be optimized for SEO relevant for the type of business the website is about. The entire goal of the Blog is to lead to a better SEO ranking and that people actually find the website.
- Include in every blog post at least one image you create with Nano Banana 2. The images can show anything but they have to perfectly underline the message of the blog post.
- For the image creation with nano banana 2 I provide you some files that you have to turn into another skill that you use when the Blog Post skill is called but that you can also use in general to create images with nano banana 2. Here is the docs for using nano banana 2 via key.ai: <https://docs.kie.ai/market/google/nanobanana2>
- When the blog post is written and the image(s) are also created you have to publish the blog post on my website. You have Server Access through the credentials in the .env file.

So in total your task is to:

- Create the blog on my website and link it in the header (you have Server Access)
- Create a Skill that can create images using nano banana 2 (some files provided)
- Create a Skill that can create the blog posts and post them on the website blog.

Prompt 2 - Initializing the project and creating a Claude.md

I want you to initialize the project by setting up suitable folders and creating a very brief but useful Claude.md. Make sure there is one Skill folder that contains all Skills. Of the project. Instruct the Claude.md to always update itself when new Skills are added or Skills change. The overall goal of this project is to create content for a website and then repurpose the content also for other platforms.

Prompt 3 - Creating the LinkedIn Poster Skill

I want you to create a Skill that takes the latest Blog Post that the Blog Post Skill created and turns it into several LinkedIn posts (text and visual). If already LinkedIn Posts about the latest Blog Post exist skip the Post creation part and move on to the posting part.

When posting you select one of the existing posts that are not posted yet and you post it. To do that you use a Python Script. I already set up a LinkedIn App at LinkedIn Developers that you can use to post on my LinkedIn Account. The authorized Redirect URL for the first Login is: <http://localhost:3000/callback>. You find the Client_ID and Client_Secret in the .env file.

Rules for creating the LinkedIn Posts:

-Text: Start with a strong hook, make the posts generally interesting and useful for business owners, use a relaxed but LinkedIn appropriate Style, always end with a Question so People can engage with the Post.

-Visual: Always create a 4:5 image, give every visual the same style and background, aim for a sleek modern SaaS style, make the illustrations not too full and complex so people can easily understand them. When using Text, make sure it is readable, Give every visual a Title that has always the same style.

Important:

- Include a mechanism so the skill knows what has been already posted
- When done, include the new Skill to the Claude.md

Prompt 4 - Creating the Talking Head Avatar Videos Skill

I want you to create a new skill for me, that uses the already existing LinkedIn Posts and turns them into talking head AI Avatar videos using the HeyGen API.

This is the Flow the Skill has to do:

- 1) Select a not yet (as video) posted LinkedIn Post
- 2) Turn it into a text only video script (max. 30-45 seconds long) that the AI Avatar should say (only what he should say no additional information such as titles and instructions)
- 3) Use the HeyGen API to create a 9:16 video of the Avatar with the ID... and Voice ID ... saying the script you created. Here is the HeyGen API docs: <https://docs.heygen.com/reference/create-video-1>. I just saw they are also offering a CLI, MCP and other options. Select the best approach for what I want to achieve: <https://developers.heygen.com/cli>
- 4) Download the video from HeyGen when it is done.
- 5) Transcribe the video when it is done to find out what the avatar says exactly when using Whisper.
- 6) Decide for 2-3 suitable B-roll images that would perfectly underline what the avatar is saying and when these images should be blended in. Make sure each image is seen between minimum 2 seconds and 5 seconds max.
- 7) Create the prompts for these images and create them with the nano banana 2 skill.
- 8) Download the images.
- 9) Create Captions that perfectly match the timing of the Avatar speech.
- 10) Assemble the entire video using ffmpeg. The goal is to have a talking head video of the avatar saying the script, suitable B-roll images being blended in at the right time (nice 0.2 sec. fade in and fade out) and having a nice caption perfectly timed with the talking speed.
- 11) When the Video is done, post it on my YouTube channel. The authorized Redirect URL is <http://localhost:8080/> the Client ID and Client Secret for the YouTube API is provided in the .env.

Important: I already created a similar skill in the past that already knows exactly how to do the process of transcribing, writing prompts, creating the caption and timing and assembling the video with ffmpeg. Be aware that skill.md I provide you was about creating videos just consisting out of images but the principle how to create the captions and assemble the video should be the same. So use it to faster find out how to do it. The Caption Style should be exactly the same as in the example skill.md.

When you are done, update the Claude.m

Prompt 5 - Creating a Skill to run all Skills in a row

I want you to create a Skill, that runs all Skills (Blog Post, LinkedIn Post, Avatar Video) in a row, so that there is a new Blog Post created and published on the website, a Post is created/posted on LinkedIn and an AI Avatar talking head Video is created and posted on YouTube.

I want the Skill to ask: "Full Run or only LinkedIn/YouTube posting". Because there are more LinkedIn Posts than Blog Posts and I want the opportunity to only post on these platforms too.

Also Implement a Cron Job for the second Skill Mode (only LinkedIn and YouTube), so that every day at 8:00 AM (South Africa Time Zone) there are automated Posts going out at LinkedIn and YouTube. (Blog posts only when I trigger that manually). I know that my computer has to be switched on for that, so implement it in a way the Cron Job checks if it is after 8:00 and if the Skill was already triggered today. Then it decides if it should run the Skill or not.

When you are done, update the Claude.m
