

Prompt - Proposal & Contract Generator

I want you to build the following proposal and contract generator application on my server for me (you have server access via .env):

- The app gets triggered by a fireflies webhook, when a Zoom meeting ended and a fireflies AI notetaker transcript exists. Tell me exactly which Webhook URL and which Signing secret I should set up at Fireflies when setting up the Webhook. Here is the link to the fireflies documentation: <https://docs.fireflies.ai/getting-started/introduction> Find out exactly how the firefly webhook works.

- For the Webhook tell me what I need to enter at fireflies: https://IP_ADDRESS.sslip.io/webhook/fireflies using that webhook type

- The app uses GPT4.1 by Azure OpenAI to analyze the transcript/summary and understands what needs to be done and then it writes a brief offer Email and a pdf contract for the client in the same style as shown in the examples (email and contract). The Azure OpenAI API key and the other credentials are also provided in .env.

- The app then uses the access to a Google Cloud Console project (Client_ID and Client_Secret provided) to create a google docs for the offer and also for the contract. If it is recommended to set up a template initially so the company logo is also available in the contract, do that as well. Tell me which authorized redirect URL/URI I should set up at the Google Project so the App can automatically access google docs and so on.

So the goal is to have two google documents automatically as soon as a meeting ends and the app did its work.

Important:

The LLM should always check the example contract and also the example offers in the project folder and should create the documents very similar to the examples, just adjusted to the current situation. The LLM should not interpret too freely but stick very close to what was actually said.

Implement a way we can trigger the app manually to pull the latest transcript so we can also test it for the debugging without having to actually host a meeting every time. There is one transcript already available.

Get the Logo your self as it is already on the server e.g. used within the invoice creator application.
