

Prompt - Email Analyzer and Auto responder

I want you to build a Python based E-Mail analyzer and auto responder. The idea is to have an App running on my server, that gets triggered by any new Email that is coming in and then analyzes them and performs certain actions. The analyzes of the Mails has to be done by an Azure Open AI LLM (azure OpenAI API Key and Credentials are provided in .env).

(Add here optionally to Strip the customer name for the analysis step. In that case auto responding would not be possible)

Here is what kind of logic should be applied to all mails:

- Every Mail that is not on the white list has to be analyzed by the Azure OpenAI LLM, gpt4o mini (white list provided). White List Emails should stay untouched.

- Spam, Commercials, default mails of payment providers, Newsletters and any kind of Sales Outreach Mails have to be moved automatically to Spam. Exception to that: Companies asking if I am interested in a YouTube Collaboration. These Mails should stay untouched in the Mail Box.

- Every Mail that is a response/answer to a mail that I send out should also stay untouched.

- Every Mail that is clearly showing interest in working with me (they wanting to hire my AI Automation services) has to get an immediate auto response telling the person reaching out, that we thank for reaching out and that we kindly ask to book a free strategy call via the Calendly Link attached: <https://calendly.com/dominik-limitless-ai-solutions/30min?month=2026-04>

The Mail has to end with the mail signature provided and the company logo in a suitable size above the signature. Make sure the logo and the signature look well formatted. The mail has to sound genuine and polite, suitable to the mail of the person reaching out. Therefore the Mail also should be written with a LLM of Azure. Important: Add: germanaicreator@gmail.com as BCC to EVERY mail the system sends out so I always can double check if the mail went out correctly. After the Calendly Link just end the mail with

"I am looking forward to speaking with you.

Best regards

Dominik"

(Logo)

(Signature)

- Always answer in the language the customer uses. Adapt also the greetings accordingly.

- The Email automation should be a python app running on my server (access to the server in .env) Its important the app checks often for new mails to not miss anything. Also if several mails got send since the last check that has to be recognized so that all new Emails get processed.

- The Mail account is a Hostinger account (password in .env)

- Incoming server (IMAP): imap.hostinger.com (993)

- outgoing server (SMTP): smtp.hostinger.com (587)

Important:

ONLY new emails should be considered and not the ones that are already in my mail account!! When the app starts I just want it to handle any new incoming mails and take now action regarding the existing mails.
