

Prompt Business Command Center:

I want you now to create me a business command center. That means we bring different systems and websites you created for me together. Here is what we combine:

- Revenue Dashboard
- Invoice Creator
- Blog Post Creation, LinkedIn Post Creation, AI Avatar Short Creation
- File Anonymizer

Here are the details:

- Deploy the Business Command Center to a new domain (DNS is already set up): <https://controlcenter.rosalia-yachts.com>
- Create. The entire frontend with the frontend design skill and give it the same design as the already existing webpages of my systems
- There should be one central login and then a starting page where the user can select the different systems: (Revenue Dashboard, Invoice Creator, Content Center, File Anonymizer). Create like 4 big buttons/icons that look great and that the user can click on to get to the system selected
- Regarding Revenue Dashboard just copy what already exists but when coming through the Business Command Center there should not be another login as the user already logged in to the business center.
- Same goes for the invoice Dashboard.
- File Anonymizer is a local python app at the moment. Copy it to the server so it runs there and then integrate it the same way as the revenue dashboard and the invoice creator to the business command center.
- The entire Content Creation is separated into different Claude Code Skills at the moment. That should stay. So set it up in a way that the user can also call these skills from the business command center. There are 4 separate skills:
 - content-pipeline.md (that runs the full pipeline)
 - blog-post.md
 - linkedin-post.md
 - linkedin-avatar-video.md

Any created media content should get uploaded to the server so it can be displayed and reviewed in the dashboard (LinkedIn Posts & AI Avatar Videos). Regarding Blog Posts there should only show up a Link to the latest Blog Post and the blog image in a nice way.

Here is the link to the claude code docs in case you don't know how to call these skills from the dashboard: <https://code.claude.com/docs/en/overview>

It would be great if these skills can be called from the dashboard without having the need to have Claude Code opened (I typically use Claude code via google antigravity)

Important:

Every system mentioned here is already working for itself. All the websites are online and also working. Don't mess anything up regarding that. Your task is to create the system I told you.
